License	MIT Open Source
Version	1.0 — October 2026

1. PROJECT NAME

TokenForge

ERC-20 Token Factory

2. PROJECT BLURB

TokenForge is a permissionless ERC-20 token factory built on Botchain that lets any wallet deploy their own fully-featured token in a single transaction. Users configure token name, symbol, initial supply, decimals, and optional features (Mintable, Burnable, Pausable) through a clean UI. One factory contract is deployed once on Botchain; every createToken() call spawns a fresh, independent ERC-20 contract owned entirely by the caller. Built on OpenZeppelin v5, it is production-safe and fully auditable from day one.

3. PROJECT WEBSITE

4. CO-MARKETING OPPORTUNITIES

1 **Botchain Launchpad Partner**
Projects that create tokens on TokenForge get automatic listing eligibility on Botchain-native DEXs and launchpads, creating a direct funnel from token creation to live liquidity.

2 **Community Token Campaigns**
Botchain DAOs and communities spin up governance or reward tokens in minutes, then co-promote TokenForge to their audiences, growing both the platform and the broader Botchain ecosystem.

3 **Botchain Grant Program**
Promote TokenForge through official Botchain grant and incentive programs, positioning it as the fastest and most accessible path from idea to live token on the network.

4 **Developer Education Series**
Partner with Web3 developer bootcamps and Botchain builder communities to teach token creation using TokenForge as the hands-on deployment tool in live workshops.

5 **Wallet-Native Token Creation**

Integrate TokenForge's factory contract with Botchain-compatible wallets so users can deploy their own tokens directly from their wallet interface without leaving the app.
